

Research Evidence Supporting Atmos Lens

1. Workplace Loneliness Is a Growing Problem

According to Gallup's 2024 global workplace report, approximately 1 in 5 employees worldwide report feeling lonely.

Loneliness in the workplace has been associated with:

- Lower engagement
- Reduced job satisfaction
- Higher turnover intentions
- Poorer mental wellbeing

As organizations increasingly adopt hybrid work models, employees often experience fewer spontaneous interactions and reduced social connection.

How Atmos Lens Helps

Atmos Lens introduces Social Mode, which promotes ambient awareness of coworkers' availability and encourages meaningful workplace interactions without requiring additional meetings or messaging platforms.

Research suggests that stronger workplace relationships are associated with higher engagement and better organizational outcomes.

2. Employees With Strong Workplace Friendships Perform Better

Gallup research has repeatedly found that employees who have strong workplace friendships demonstrate:

- Higher engagement
- Better retention
- Improved safety outcomes
- Greater productivity

Despite these benefits, only about 2 in 10 U.S. employees report having a "best friend" at work.

This suggests a significant opportunity to improve workplace connection and belonging.

How Atmos Lens Helps

Social Mode creates low-friction opportunities for collaboration and interaction, helping employees build relationships without disrupting focus.

3. Workplace Interruptions Have a Significant Cognitive Cost

Research conducted at the University of California, Irvine found that workers are interrupted frequently throughout the day.

Key findings include:

- Average uninterrupted work period: approximately 12 minutes
- Average time required to return to the original task: approximately 25 minutes
- Average time needed to regain deep concentration: approximately 15 minutes

Even brief interruptions can significantly reduce productivity and increase mental fatigue.

How Atmos Lens Helps

Focus Mode creates intentional focus periods through environmental cues, breathing guidance, and reduced distraction.

The objective is not to eliminate collaboration but to protect periods of deep work.

4. Open Office Environments Create Attention Challenges

Research shows that approximately 63% of tasks in open office environments are interrupted before completion.

Common causes include:

- Noise
- Visual distractions
- Coworker interruptions
- Environmental overload

These interruptions increase cognitive switching and reduce focus quality.

How Atmos Lens Helps

Guidance Mode helps employees identify spaces better suited to their current work requirements, whether they need collaboration, quiet concentration, or recovery.

5. Micro-Breaks Improve Wellbeing

A large meta-analysis published in PLOS ONE reviewed 22 studies involving more than 2,300 participants.

Researchers found that micro-breaks:

- Reduce fatigue
- Improve vigor and energy
- Improve overall wellbeing
- Help workers recover from accumulated mental strain

Recovery periods were found to be especially valuable for sustaining performance over time.

How Atmos Lens Helps

Recharge Mode provides gentle reminders encouraging employees to step away briefly before fatigue becomes overwhelming.

Rather than maximizing output, the goal is sustainable performance.

6. Employee Engagement Remains Low Globally

Gallup's global engagement research indicates that only approximately 23% of employees worldwide are actively engaged at work.

Low engagement is associated with:

- Reduced productivity
- Increased absenteeism
- Higher turnover
- Lower wellbeing

Organizations continue to seek new approaches for improving engagement without increasing employee pressure.

How Atmos Lens Helps

Atmos Lens focuses on creating conditions that support engagement:

- Better focus
- Better recovery
- Better workplace connection
- Better environmental awareness

Instead of measuring productivity, Atmos Lens aims to improve the human experience of work.

Key Takeaway

Atmos Lens is not designed to increase productivity through monitoring, surveillance, or performance tracking.

Instead, it addresses four evidence-backed drivers of workplace effectiveness:

1. Attention and Focus
2. Social Connection
3. Recovery and Wellbeing
4. Environmental Fit

Research suggests that improvements in these areas contribute to healthier, more engaged, and more productive workplaces.

Atmos Lens applies these findings through a wearable AR experience that supports employees in real time while preserving privacy, autonomy, and trust.
